DATA COLLECTION FOR LIFE CYCLE ASSESSMENT OF POWDER GELCOAT

Bachelor’s thesis
CENTRIA UNIVERSITY OF APPLIED SCIENCES
Chemistry and Technology
November 2016
This thesis is a part of European Union project Ecogel Cronos which aims to conduct data collection for life cycle assessment of zero volatile organic compound powder gelcoat with fast curing properties from acquiring the ingredients until the process of curing of the powder gelcoat.

The aim of this thesis work is to focus on collecting information from production process of the main ingredient of the powder gelcoat - unsaturated polyester resin, as well as from the production process of powder gelcoat. Combined and quantified results from both processes were compiled to be used in creating simulation process with SimaPro 8 Life Cycle Assessment software.

As a result, information form production processes was collected as precisely as possible. Appropriate calculations were conducted in accordance with formulations of the unsaturated polyester resin and the powder gelcoat. Necessary calculations and educational estimations upon available and unavailable ingredients were compiled for SimaPro 8 software. The base for the continuation of the research was established.

Key words
Ecogel Cronos, data collection, Life Cycle Assessment, powder gelcoat, SimaPro 8 software, unsaturated polyester resin
ABSTRACT

CONTENTS

1 INTRODUCTION ................................................................................................................................ 1

2 LIFE CYCLE ASSESSMENT ............................................................................................................. 3
  2.1 General description of LCA .......................................................................................................... 3
    2.1.1 Phases of LCA .................................................................................................................. 4
    2.1.2 Function of the system ...................................................................................................... 5
    2.1.3 General concepts of product systems ............................................................................. 6
  2.2 Methodological framework ......................................................................................................... 7
    2.2.1 System boundaries ........................................................................................................... 8
    2.2.2 Life Cycle Inventory ........................................................................................................ 10
    2.2.3 Life Cycle Impact Assessment ....................................................................................... 11

3 THESIS REFERENCE TO ECOGEL CRONOS PROJECT ............................................................ 14
  3.1 Types of resins .............................................................................................................................. 14
    3.1.1 Epoxy resins ....................................................................................................................... 15
    3.1.2 Vinyl-ester resins ............................................................................................................... 15
    3.1.3 Unsaturated polyester resins ............................................................................................ 16
  3.2 Liquid (conventional) and powder gelcoats ............................................................................... 17
    3.2.1 Liquid gelcoat (conventional) ............................................................................................ 17
    3.2.2 Powder gelcoat .................................................................................................................. 18
  3.3 Methodology of research ............................................................................................................. 19
  3.4 Production processes .................................................................................................................... 19
    3.4.1 Unsaturated polyester resin production process ............................................................. 20
    3.4.2 Powder gelcoat production process .................................................................................. 21

4 LIFE CYCLE ASSESSMENT SOFTWARE SIMAPRO 8 .................................................................... 24
  4.1 SimaPro 8 ...................................................................................................................................... 24
  4.2 SimaPro 8 software analysis ......................................................................................................... 24

5 RESULTS ........................................................................................................................................... 26
  5.1 Energy consumption calculations for UP resin ......................................................................... 26
  5.2 Energy consumption calculations for powder gelcoat .............................................................. 27
  5.3 Ingredients’ availability of UP resin and powder gelcoat for LCA software ............................ 29
  5.4 Calculation results used for SimaPro 8 technosphere ................................................................. 32

6 CONCLUSION .................................................................................................................................. 36
